### The genera *Saaristoa* n.gen. and *Metapanamomops* Millidge (Araneae: Linyphiidae)

A. F. Millidge

Little Farthing,  
Upper Westhill Road,  
Lyme Regis, Dorset DT7 3ER

In a paper published recently (Millidge, 1977) the author erected two genera, *Saaristoa* and *Metapanamomops*. By an oversight, the type species of these two genera were not designated. *Metapanamomops* is available by monotypy, but *Saaristoa* is unavailable under Rule 13b of I.C.Z.N. It is the purpose of this short note to designate the type species of *Saaristoa* and to make the generic name available from the date of publication of the present paper.

#### Genus *Saaristoa* n.gen.

This genus is erected for the species *abnormis* Bl.

and *firmus* Cambr., previously placed in the genus *Oreonetides* Strand 1901. The genus is named for M. Saaristo, who indicated (1972) that these species are not congeneric with the type species (*vaginatus* Thor.) of *Oreonetides*. The type species of *Saaristoa* is *abnormis*. The genus is defined by the conformation of the male palp (Millidge, 1977) and by the chaetotaxy: the species have 2 dorsal spines on the tibiae, and there are no metatarsal spines; TmI (♀) is 0.35-0.45, and metatarsus IV has no trichobothrium.
