Summary

The first check list of the Hungarian spider fauna is presented since the 1918 check list by Chyzer and Kulczyński. All pre-1900 records are included from the Chyzer and Kulczyński list. For the period 1900–1996 the literature has been extensively searched, and records are included from the original sources. Records are listed only from locations within the present borders of Hungary. Altogether the present list is based on 108 literature items, in which there were 6010 records for 725 spider species from the country.

Introduction

The preservation of global and local biodiversity requires knowledge about patterns of diversity. Fauna lists of spiders have traditionally served this purpose. Such lists can be established at different scales, for whole countries (Merrett *et al.*, 1985; Pesarini, 1994; Buchar *et al.*, 1995; Mikhailov, 1996), or smaller regions, such as a national park (Coddington *et al.*, 1996). Fauna lists are inventories, which not only help to establish patterns of biodiversity, but also serve as raw material for more detailed ecological studies. Their electronic publication via the Internet (e.g. Langemark; Working group arachnology, 1996; Vanuytven, 1998) or in other database formats (Hanggi *et al.*, 1995) makes their availability wider and easier.

Arachnological studies in Hungary have a long tradition. Listing the spider fauna was started by Ottó Herman (1876–1879) and was continued by Cornél Chyzer and László Kulczyński (1891, 1894, 1897). Based on their three-volume seminal work, the first and until now the only fauna list of Hungarian spiders was published in 1918 by Chyzer & Kulczyński (1918a,b). In the present list we set out to revise this list with published spider data originating after 1900, in a format where all known references are given for each species included in the list. We hope that an electronic publication of our results will follow in the near future.

Material and methods

Scope of data included in check list

Area: Only records from locations within the present borders of Hungary are included.

Time period: The check list is based on the last published check list from Hungary by Chyzer & Kulczyński (1918a, b). Those papers gave a comprehensive and critical list of all previous arachnological records, since the pioneering work by Herman (1876, 1878, 1879). For records after 1900 the authors have extensively searched the literature between 1900 and 1998.

Sources: Concerning the Chyzer & Kulczyński (1918a,b) papers, it has to be mentioned that they were completed in 1896 and 1900 respectively, but remained unpublished until 1918. These papers synthesise all records from the better known three-volume *Araneae Hungariae* (Chyzer & Kulczyński, 1891, 1894, 1897). The coverage of literature after 1900 is almost complete. Szinetár & Samu (1995) gave a comprehensive list of Hungarian arachnological literature. In the present list, to our knowledge we have included all records from Balogh, Loksa and other contemporary arachnologists. Kolosváry was an extremely prolific author, and we have been able to examine *c.* 95% of his papers, including all important faunistic reports. The reason why many papers which might be well known in the arachnological literature, but to which no reference can be found here, is simply that these papers contained records only from outside Hungary.

Data validation procedures

Species identity: The taxonomic names mainly follow the nomenclature in Platnick (1997). Original names in the sources were often synonyms. These were checked and if possible cleared using the catalogues of Bonnet (1945, 1955–1959, 1961), Roewer (1942, 1955), Brignoli (1983) and Platnick (1989, 1993, 1997), but other sources, such as Prószyński's computer catalogue (1993) and original species descriptions, were also used.

In cases where one or more sibling species have been described based on one original species, or where subspecies have been elevated to species rank, the original species name is listed either *sensu stricto* or *sensu lato*. In cases where we know that the species has been identified according to the narrower definition, we list it as *sensu stricto*. We have indicated *sensu lato* in cases where either the records originated before the sibling species were described, or in cases where it was impossible to establish whether the species names have been used in the wider or in the narrower sense. For species given as *sensu lato*, the names of sibling species included under that name are listed. In some species records are known in both senses, and these are shown as separate entries, but counted only as one species.

We have classified species as invalid if their identity could not be established, or if their validity was questionable (*nomen dubium*), or in one case because it was stated to be a *nomen nudum* in the literature (Loksa, 1972).

Location validity: Each record in the literature was checked, as to whether the original location is within the present borders of Hungary, using old locality lists and

maps. A complete locality list in the second volume of Chyzer & Kulczyński (1897) was especially useful.

Record validity: There was no exact way to check the validity of the records. We declare the present paper to be a literature survey. Accordingly no specimens from collections were checked. However, we realise that there was a wide range of different quality data. In the overwhelming majority of cases we had no reason to doubt the precision and validity of the records. Special care was taken of species found in one or very few records. Many of these were supported by our own unpublished data. Others were less certain, but we had no grounds to exclude them. A separate list of these uncertain species is given below. Species that deserve special attention because they were originally described from Hungary are also listed separately.

A record was classified as invalid if any of the following circumstances were met: (i) Occurrence is considered highly unlikely on the basis of known biology, habitat preference and distribution. These species usually were restricted in known occurrence to high mountains, seashores, or were Mediterranean species. They have not been mentioned from any habitat probable in Hungary in the check lists of neighbouring countries (Drenski, 1936; Fuhn & Oltean, 1970; Nikolic & Polenec, 1981; Weiss, 1987; Buchar, 1992; Pesarini, 1994; Buchar *et al.*, 1995; Platen *et al.*, 1995; Kropf & Horak, 1996; Mikhailov, 1996). (ii) Records examined by Loksa (1969a, 1972) and declared to be not valid. We are not sure, but it is likely, that this declaration was based on the examination of specimens. (iii) Revision of the identification made by the author of the given record in a later paper, or unpublished self-revision in the case of Samu and Szinétár.

Results of species and record validation

Invalid species (not included in check list)

We classified most of the species described by Kolosváry from Hungary as *nomina dubia* (many other species were described by him from outside the area of Hungary, and thus fall outside our scope). These species have seldom if ever been mentioned after the original description, and in many cases only one sex was found by Kolosváry. Considering the original descriptions, it is hardly likely that these Kolosváry species will be vali-

dated, given the unknown location of type material and the poor quality of the drawings.

In the list of invalid species (Table 1) the original species name is given, as it occurred in the source literature. It sometimes lacked the year of description.

Probably invalid records (not in check list)

Based on the criteria described in the data validation section, the records presented in Table 2 are regarded as invalid.

Possibly uncertain records (in check list)

We give a list of “somewhat uncertain species”, which we feel might be problematic. Species were included in this list on the basis of comments on previous versions of the list by T. Blick, K. Thaler and P. Merrett; known distribution made occurrence questionable, but still possible to some degree (cf. list of invalid records). These species are listed here to indicate that some caution should be paid when accepting the record as valid for Hungary.

several *Porrhomma* specimens originating from Hungary. According to their results all *Porrhomma rosenhaueri* records before that study were in fact *Porrhomma profundum*. The record of *Porrhomma errans* by Kolosváry (1928a) is also *P. profundum* (Miller & Kratochvil, 1940). The subspecies *Porrhomma rosenhaueri hungaricum* Loksa, 1970 is a junior synonym of *P. profundum* (Thaler & Plachter, 1983). Thus only one record each of *P. errans* and *P. rosenhaueri* remained which we regard as valid (but draw attention to them, by listing them above); both records were identified by Loksa. *Porrhomma thorelli* mentioned by Chyzer & Kulczyński (1918a) = *P. convexum*. *P. errans* sensu Chyzer & Kulczyński (1894) = *P. proserpina* (Miller & Kratochvil, 1940). Since *Porrhomma proserpina* is regarded as a junior synonym of *P. convexum* (Holm, 1944), all records of *P. proserpina* are listed under *P. convexum*. However, we noted that the reported habitats were systematically different between the two nominal species; *P. proserpina* having always been reported from caves and *P. convexum* from various non-cave habitats. Only a future examination of the Hungarian cave *Porrhomma* spp. can resolve this problem.

New species described from Hungary after 1900 (in check list)

The following new species, described from Hungary after 1900, are regarded as valid:

- Altella hungarica* Loksa, 1981b
- Altella orientalis* Balogh, 1935
- Brommella falcigera* (Balogh, 1935)
- Metopobactrus deserticola* Loksa, 1981b
- Sintula spiniger* (Balogh, 1935)

Xysticus embriki Kolosváry, 1935c
Cryptodrassus hungaricus (Balogh, 1935) — this species was described as *Zelotes hungaricus* Balogh and transferred to the genus *Cryptodrassus* by Weiss *et al.*, 1998.

Acknowledgements

The authors are grateful to many colleagues who have seen and revised previous versions of the manuscript. Special thanks are due to Drs Theo Blick, Jan Buchar, Peter Merrett, Konrad Thaler, Søren Toft, Jörg Wunderlich and two anonymous referees. We thank Mrs Erika Botos for technical assistance and Mrs Éva Szita for help in acquiring some of the literature. The project was supported by OTKA grant No. F 17691 and grants from the HAS Ecological Centre. F. Samu was Magyar

Fellow and Bolyai Fellow at different stages of the work.
